Algorithm to Code

Selection Sort Algorithm

OUT OF PLACE SORT

```
def selection_sort(a_list):

    ##sorted <-- empty list of n length

    ##repeat n times

        ##set the first element as the minimum

        ##for each of the elements in list from (1 ... n)
            ##if element < minimum then set element as new minimum

        ##remove minimum from list
        ##add minimum to end of sorted

numbers = [8, 8, 18, 13, 36, 0, 2, -2, -5]
selection_sort(numbers)
print(numbers)
```

IN PLACE SORT

```
def selection_sort(a_list):

    ##repeat (numOfElements - 1) times

       ##set the first unsorted element as the minimum

       ##for each of the unsorted elements

           ##if element < currentMinimum
              ##set element as new minimum

       ##swap minimum with first unsorted position

numbers = [8, 8, 18, 13, 36, 0, 2, -2, -5]
selection_sort(numbers)
print(numbers)
```
